Application No.: 10/500,937

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in

the application:

1. (Original) A formwork structure located on supporting surface, the

structure having a side form perimeter including side form members, the

perimeter defining a curable non-solid material retaining area; the formwork

including side form support members that support the side form members, the

side form support members being held in a fixed position relative to the

supporting surface by a surface-to-member releasable securing device fixed to the

supporting surface and which engages the side form member, characterised in

that the side form member is adapted to permit another side form member to be

secured thereto by one or more releasable inter-member securing devices, which

are separate to the surface-to-member securing device.

2. (Original) The formwork of claim 1 wherein additional support

members are secured on top of previously secured support members.

- 2 -

Application No.: 10/500,937

3. (Original) The formwork of claim 2 wherein each additional support

member is secured by one or more separate inter-member securing devices.

4. (Original) A formwork structure located on supporting surface, the

structure having a side form perimeter including side form members, the

perimeter defining a curable non-solid material retaining area; the formwork

including side form support members that support the side form members and

being held in a fixed position relative to the supporting surface, the side form

support members having a top support surface capable of supporting another side

form support member thereon and a bottom resting surface for contacting the

supporting surface of the formwork or another member's top support surface,

characterised in that the side form support member is secured into a fixed position

by using a securing device which engages to an attachment surface of the member

which is a separate and distinct surface to the top support surface of the member.

5. (Original) A formwork structure of claim 4 wherein the securing

means includes surface-to-member securing device for fixing to an underlying surface

and being capable of releasibly securing a member.

6. (Previously presented) A formwork structure of claim 4 wherein the

- 3 -

Application No.: 10/500,937

securing means includes 5 inter-member securing device for secured member

capable of securing another member to the secured member.

7. (Withdrawn) A surface-to-member securing device for use with formwork

structures having a base plate for securing to an underlying supporting surface, a

clamping element joined to the plate and capable of releasibly securing a side

form support member, wherein the clamping element includes at least one arm that is

capable of engaging an attachment surface of the member which is a separate and

distinct surface to the top support surface of the member.

8. (Withdrawn) The device of claim 7 wherein the surface-to-member

securing device releasibly engages the side form member.

9. (Withdrawn) The device of claim 8 wherein the side form support

members support the side form members by having the end of one or more side

form support members engage a portion of the side of a side form member.

10. (Withdrawn) The device of claim 9 wherein the device includes a level

adjustment means for modifying the level of a side form support member secured to the 20

device.

- 4 -

Application No.: 10/500,937

11. (Withdrawn) The device of claim 10 wherein the base plate is capable of being

secured to an underlying surface at a securing point and the level adjustment means is

connected to the base plate and includes at least one leg having an adjustable length

capable of contacting the underlying surface, such that adjusting the length of the leg will

pivot the base plate about the securing point and change the level of the base plate and side

form support members attached thereto.

12. (Withdrawn) The device of claim 10 wherein the base plate is capable of

being secured to an underlying surface at a securing point and the level

adjustment means is connected to the base plate and includes at least a side form

support member contact device that is capable of being moved relative to the base plate and

thereby change the level of side form support member relative to the base plate.

13. (Original) A side-form support member capable of engaging supporting a

side-form that constitutes part of a formwork structure for retaining curable

non-solid material, the member having a top support surface capable of

supporting another member, a bottom resting surface for contacting and being

supported by an underlying top support surface of a further member, and one or

more attachment surfaces separate to and distinct from the top and bottom

- 5 -

**Application No.:** 10/500,937

surfaces, wherein the attachment surfaces inter-member securing devices

engage therewith and secure the member to adjacent member by attachment

surfaces of the adjacent member.

14. (Original) The member of claim 13 having at least one channel having

internal surfaces, that in part defines an attachment surface of the member.

15. (Original) The member of claim 14 having two opposed sides that extend

from the top and bottom surfaces, each side having two channels therein, an

upper channel located near the top surface and a lower channel located near the

bottom surface.

16. (Original) The member of claim 15 wherein the member has a

substantially "I" shape.

17. (Original) A member of claim 13 formed by extrusion.

18. (Previously presented) A member of claim 13 wherein the support

members and side-form members are the same in cross-section.

. 6 -

**Application No.:** 10/500,937

19. (Original) A side form member used in defining a perimeter for

retaining curable non-solid material, the member having a top support

surface capable of supporting another member, a bottom resting surface for

contacting and being supported by an underlying support surface, the member

having two opposed sides that extend from the top and bottom surfaces, a support

side capable of being supported by one or more side-form support members, and a

retaining side, wherein the retaining side is capable of having side-moulds affixed thereto.

20. (Original) The side form of claim 19 wherein the retaining side

includes two channels therein, an upper channel located near the top surface

and a lower channel located near the bottom surface by which a side-mould may be

affixed thereto.

21. (Original) The side form of claim 20 wherein the support side has two

channels therein, an upper channel located near the top surface and a lower

channel located near the bottom surface, the channels facilitating the attachment

of one or more side form support members to the side-form members.

22. (Original) A formwork structure that uses side-form members of claim 19.

- 7 -

Application No.: 10/500,937

23. (Original) A formwork structure that uses side form support members of claim

13.

24. (Original) A formwork structure for use in the manufacture of a multiple

layer stack of construction panels and structures, preferably concrete construction

panels, the structure having a plurality of side form support members of claim 13.

25. (Original) The formwork structure of claim 24 that includes a plurality

workmate surface-to-member securing devices and a plurality of

member-to-member securing devices.

26. (Withdrawn) A method of constructing formwork having side form

members and side form support members wherein adjacent support members are secured

together by using individual clamps between adjacent support members.
